

S/No	Feature	Story number	Description (Card)
1	Storing Customer Data – SQL	US005	As a developer, I want to create tables so that I can store customer details.
2	Add Column – SQL	US006	As a developer I want to add additional columns to the table – Customer
3	Retrieve Customer Details – SQL	US007	As a Developer I want to retrieve the Customer details whose name ends with 'a'
	Calculating average bill per city – SQL	US008	As an admin, I want to understand the average bill per city and want to know the city with highest consumption.

Getting Details about unpaid Consumers- SQL	US009	As an admin, I want to get details of the consumer who have not paid the bill yet.
---	-------	---

Acceptance Criteria (Confirmation)

* The table should contain option for capturing the following information

- Consumer ID: An integer value for consumer ID (13 digit number)
- Customer Name: A text value for Customer name(Maximum 50 characters)
- Email: A text field to capture the Email.
- Mobile number
- User ID: <textbox min 5 and max 20>
- Password: A text value for Password(Maximum 30 characters)
- Confirm Password: A text value for confirm password(Maximum 30 characters)
- Status: (Active/Inactive)

* Design the attribute with proper data type and primary key.

* Create the table script as an .sql file.

* Insert 5 customers information to this table. Create the insert script for the same. Also save it as a customer.sql file.

Add the below columns to the table-Customer

- Title: <Select box>
- Bill Number: An integer value for bill number(last 5 digit number of consumer bill)

* Create the table script as an .sql file.

* Create Customer Table in DB.

* Create the table script as an .sql file.

* Add 5 rows in the table. Create the insert script for the same. Also save it as an .sql file.

* Write a SQL statement for retrieving the customer details whose name ends with 'a'. Sort it descending order based on customer name

-The query result should contain the following attributes;

CustomerId | CustomerName | Email

* The table should contain customer details like consumer id,name, address, city,bill of the consumer.

* Design the attribute with proper data type and primary key.

* Create the table script as an .sql file.

* Insert 10 bill details to this table for 3-4 customers together. Create an SQL script which would give the average bill per city and arrange them in descending order. Also save it as an .sql file.

- * There should be two tables Consumer table and Monthly Bill table for the month of June.
- * Design the attribute with proper datatype and primary key.
- * Create the table script as a .sql file.
- * Insert 10 details in both the tables. Create a SQL query which would give the ConsumerId and ConsumerName from the Consumers table based upon the ConsumerIDs of, Bills table who failed to pay the bill.
- * Use IN operator and Where operator wherever necessary. Also save it as a .sql file.
